

f has shape (N_x, N_y, N_μ) ; the interpolation acts on the leading two axes only.

$$\text{out}[i, j, m] = \sum_{p, q \in \{0, 1\}} w_p^x[i, j, m] w_q^y[i, j, m] f[i_{px}[i, j, m], i_{qy}[i, j, m], m]$$

The third slot of f is a bare m , never $i[m]$ (no slice reads from another).
